Good morning, sir/ma'am.

My name is Kiran B. Harak. I am currently pursuing my Master of Computer Applications at Sardar Patel Institute of Technology, Mumbai, with a current CGPA of 8.36.

I have a strong interest in software development, particularly backend development, full-stack applications, and AI-based systems.

I have worked on two major projects.

The first is **Drishya Vaani**, an Indian Sign Language translation system, where I worked with MediaPipe, OpenCV, FastAPI, WebSocket, and WebRTC. I built a gesture classification pipeline using PCA, StandardScaler, and SVM, achieving more than 95% validation accuracy, and also worked on real-time video communication and signaling.

My second project is **VittSaathi**, a full-stack fintech application built using React and Spring Boot. It includes JWT authentication, Redis caching, PostgreSQL, Docker, and a Python-based multi-agent financial advisory system using LangGraph and Gemini. I also implemented a vector-based RAG system for context-aware access to user data.

Apart from projects, I completed a Data Analyst internship at Bluestock Fintech, where I worked on ETL pipelines, mutual fund data, REST API integration, Python-based data processing, and Power BI dashboards.

One achievement I am particularly proud of is securing AIR 100 with a 99.68 percentile in MAH MCA CET 2025 among more than 39,000 students.

Overall, I enjoy understanding how systems work end-to-end and building practical solutions using software, data, and AI. I am now looking for an opportunity where I can apply these skills, learn from experienced engineers, and contribute to real-world projects.
